

# Lawn Maintenance Schedule

## Maintenance Tips

Root growth peaks in March/April & again in October.

Aeration & renovation are best carried out before the peak of root growth to allow time for the roots to recover before shoot growth occurs.

Shoot growth peaks in June/July & again in September.

Wait & apply fertilizers in May when shoot growth begins to occur. Do not apply fertilizers too early in the year as this will cause leaves to grow at the expense of the roots.

Leave at least two weeks time between liming & fertilizing your lawn, otherwise the lime & fertilizer may neutralize each other & become ineffective.
